SHOW BUDDY SETLIST SOFTWARE LICENSE AGREEMENT

Before installing the Show Buddy Setlist software, please carefully read and agree to the following legal agreement. From here on the "Software" refers to the Show Buddy Setlist Software product in whole or in part, including all files, data and documentation. By installing the Software, you are consenting to be bound by and become a party to this agreement. If you do not agree to all of the terms of this agreement do not install the Software.

Show Buddy Setlist Software END USER LICENSE AGREEMENT

1. Copyright Notice

The Software is © Copyright 2012-2022 DB AUDIOWARE LIMITED, all rights reserved, and is protected by United Kingdom copyright laws, international treaties and all other applicable national or international laws. The sole owner of this software product is DB AUDIOWARE LIMITED.

2. License Agreement

GRANT. With respect to each Show Buddy Setlist software license owned by you, DB AUDIOWARE LIMITED grants you a non-exclusive right to install and use the Software on one computer. You may copy the Software for personal archival purposes only.

TITLE. Title, ownership rights, and intellectual property rights in and to the Software shall remain in DB AUDIOWARE LIMITED. This agreement does not include the right to copy or sublicense the Software and is personal to you.

DISCLAIMER OF WARRANTY. The Software is provided on an "AS IS" basis, without warranty of any kind, including without limitation the warranties of merchantability, fitness for a particular purpose and non-infringement. The entire risk as to the quality and performance of the Software is borne by you. Should the Software prove defective in any respect, you and not DB AUDIOWARE LIMITED assume the entire cost of any service and repair.

HIGH RISK ACTIVITIES. The Software is not fault-tolerant and is not designed or intended for use in environments requiring fail-safe performance. DB AUDIOWARE LIMITED expressly disclaims any express or implied warranty of fitness where the Software is used in any such environments.

LIMITATION OF LIABILITY. UNDER NO CIRCUMSTANCES AND UNDER NO LEGAL THEORY, TORT, CONTRACT, OR OTHERWISE, SHALL DB AUDIOWARE LIMITED OR ITS SUPPLIERS OR RESELLERS BE LIABLE TO YOU OR ANY OTHER PERSON FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES OF ANY CHARACTER INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF GOODWILL, WORK STOPPAGE, COMPUTER FAILURE OR MALFUNCTION, OR ANY AND ALL OTHER COMMERCIAL DAMAGES OR LOSSES. IN NO EVENT WILL DB AUDIOWARE LIMITED BE LIABLE FOR ANY DAMAGES IN EXCESS OF THE PURCHASE PRICE OF THE PRODUCT, EVEN IF DB AUDIOWARE LIMITED OR ANY IF ITS AUTHORISED RESELLERS SHALL HAVE BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES, OR FOR ANY CLAIM BY ANY OTHER PARTY.

LIMITATIONS ON USE. You may not use, copy, modify, translate, sell, or transfer the Software or any copy except as expressly defined in this agreement. You may not attempt to unlock or

bypass any copy-protection or authentication algorithm utilised by the Software. You may not modify, translate, reverse engineer, decompile or disassemble the software (except and solely to the extent an applicable statute expressly and specifically prohibits such restrictions), or create derivative works based on the Software. You may not redistribute the Software without the prior consent of DB AUDIOWARE LIMITED.

TERMINATION. Either party may terminate this agreement immediately in the event of default by the other party. Upon any termination of this agreement, you shall immediately discontinue the use of the Software and shall uninstall the Software and Documentation and all copies thereof.

GOVERNING LAW. The laws of Scotland govern this Agreement, and shall govern any dispute relating to this Agreement. The application of the United Nations Convention on Contracts for the International Sale of Goods is expressly excluded.

MISCELLANEOUS. This agreement represents the complete and exclusive statement of the agreements concerning this license between the parties and supersedes all prior agreements and representations between them. It may be amended only by a writing executed by both parties. If any provision of this agreement is held to be unenforceable for any reason, such provision shall be reformed only to the extent necessary to make it enforceable, and such decision shall not affect the enforceability (i) of such provision under other circumstances or (ii) of the remaining provisions hereof under all circumstances. Headings shall not be considered in interpreting this agreement.

Show Buddy Setlist EULA Rev.240212

WELCOME!

Show Buddy Setlist gives you fully automated hands-free control of your backing tracks, DMX lights, video, and MIDI equipment, but in an extremely user friendly interface, customised to the needs of the gigging professional. It's ideal for those wanting the simplest possible way to create a fully automated sound & light show.

This manual is a reference guide for Show Buddy Setlist. We also recommend you watch the Show Buddy Setlist videos available on YouTube – these will show you concisely what Show Buddy Setlist is all about, and how to get started quickly.

FREQUENTLY ASKED QUESTIONS

- ***Why should I use Show Buddy Setlist instead of something like Ableton Live, Cubase, SONAR, Logic?***

Show Buddy Setlist is specifically designed for the job of sequencing backing tracks with a light show. It integrates more tightly with Show Buddy Active and DMXIS than is possible in a VST/AU sequencer, resulting in a simpler, more visual, and ultimately more productive programming experience.

- ***Does Show Buddy Setlist do audio time-stretching, beat-matching etc?***

No. If you need access to more advanced audio features, use an advanced DAW such as Logic Audio, Cubase or Ableton Live (and use the Show Buddy Active or DMXIS VST plug-in for lighting support)

- ***What audio formats does Show Buddy Setlist support?***

Show Buddy Setlist natively supports wav, AIFF, CAF, Ogg Vorbis and FLAC audio file formats, along with any audio format supported by the underlying OS X CoreAudio or Windows DirectShow libraries. At the time of writing, both these libraries support mp3 playback.

INSTALLING SHOW BUDDY SETLIST

Show Buddy Setlist requires Show Buddy Active (version 2.1.4 or better) or DMXIS (version 1.7.3 or better) to be installed on your computer. The latest software is always freely available from www.dmxis.com/downloads.

You do NOT need to connect a DMX hardware interface to install & use the Show Buddy Setlist software.

Your Show Buddy Setlist license must be unlocked before use. For this, you need an internet connection with a web browser and a valid email address.

INSTALLING SHOW BUDDY SETLIST

- First, make sure you have installed Show Buddy Active (version 2.1.4 or better) or DMXIS (version 1.7.3 or better), both available from www.dmxis.com/download
- Download the Show Buddy Setlist installer for Windows or OS X as appropriate (link will be provided with ShareIt purchase).
- Run the Show Buddy Setlist installer and follow the instructions.

UNLOCKING SHOW BUDDY SETLIST

- Make sure you are connected to the Internet.
- Start the Show Buddy Setlist program (located in your main OS X Applications folder, or your Windows desktop).
- Follow the instructions on-screen to unlock your software.

CONFIGURING AUDIO & MIDI

Show Buddy Setlist works best with a low-latency soundcard. On OS X, the standard CoreAudio drivers usually work well. On Windows, you may need to experiment with the different available soundcard drivers to find the most reliable settings.

To modify your audio settings, open the *File > Preferences* window and go to the Audio/MIDI Devices tab. You should aim for reliable playback with latency of 20ms or less (the *audio buffer size* field). If you use higher latencies, you will find that the timing accuracy of your lighting show suffers. Sometimes, selecting <<none>> in the *input* field can significantly improve performance on Windows machines.

You can use external MIDI controllers to manually control Show Buddy Active or DMXIS during a show. Select which MIDI controllers you wish Show Buddy Setlist to react to in the *active midi inputs* table.

You can transmit MIDI patch changes and other MIDI messages from Show Buddy Setlist, to control any MIDI capable devices in your live rig (e.g. guitar multi-fx pedals, hardware vocal processors, software instruments). These messages are created via the MIDI Chunk Editor (accessed via the View menu).

LIGHTING BACKGROUND

SHOW BUDDY SETLIST OVERVIEW

So how does Show Buddy Setlist work? The process is very straightforward...

- Drag & drop your backing tracks into the Track Library.
- Create one or more **lightshows** for each track by dragging & dropping lighting presets directly onto the audio waveform. Add lyrics, key change reminders, count-ins or other visual memos as needed. If you have external MIDI devices (e.g. guitar FX processors or vocal harmonisers) you can also control these from the lightshow.
- At this point, simply busk your show by loading songs as required in the Track Library.
- Or, go one step more organised and create a show in the **Show Library** for each gig you are planning. A show is an ordered playlist of songs. Build your show by dragging in songs from the Track Library. Use a MIDI controller or the keyboard to play through the songs in order. Add, remove or re-order songs on-the-fly during your performance in response to audience requests.

Let's now take a more detailed look at each feature in Show Buddy Setlist.

STARTING SHOW BUDDY SETLIST

To start Show Buddy Setlist:

- Windows: double click on the Show Buddy Setlist icon on your desktop.
- OS X: double click on the Show Buddy Setlist icon in the main OS X applications folder.

Note that the lighting control window (Show Buddy Active or DMXIS) also opens alongside the Show Buddy Setlist window. Show Buddy Setlist is basically a host audio sequencer that automatically opens the lighting control plug-in. Like other host sequencers, you can manually control lighting while your show is playing back, via a MIDI controller. You can also design new lighting presets and manage your banks without quitting Show Buddy Setlist.

If you want to hide the lighting window at show time (it's really not necessary) you can close it from the View menu or by pressing the 'D' key.

Note : Show Buddy Setlist can run without any DMX hardware hardware being connected. This allows you to use Show Buddy Setlist as a simple audio file player & MIDI controller if you so wish (with no lighting control). It also allows you to edit your show without having access to your DMX hardware interface.

MEDIA STORAGE & BACKUP STRATEGY

Show Buddy Setlist stores all your track, lightshow and show information in a single database file. As you create and edit your tracks & shows, Show Buddy Setlist automatically and silently saves your changes to the database – there is no File Open or Save option as is found in document based programs.

You can create backups of the current database from the File > Backup database menu option. This will archive the database in a “.dbb” file. It's a good idea to backup your database regularly while you are editing, and before each live gig (so you can always recover to a known point should something go wrong).

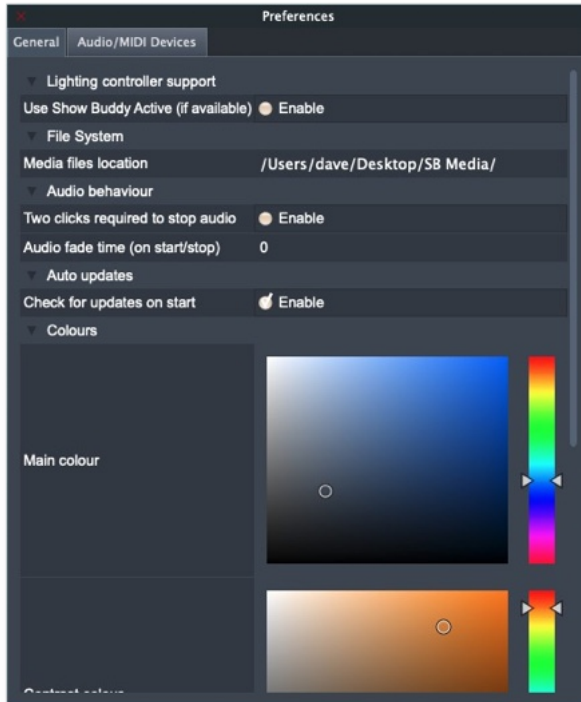

To restore from a backup, select the File > Restore from backup... menu option and choose a .dbb backup file.

Note that your actual audio tracks (e.g. wav and mp3 files) are NOT saved & restored as part of this procedure. When you drag an audio file into Show Buddy Setlist, a copy of that file is made in the Show Buddy Setlist media folder. You should separately backup this media folder on a regular basis:

- Windows: C:\ProgramData>Show Buddy Setlist\Media Files
- OS X: \Library\Application Support\db audiware\Show Buddy Setlist\Media Files

You should also backup your lighting configuration and banks/presets as well. Please see your Show Buddy Active or DMXIS documentation for more information.

PREFERENCES

The preferences window (under the File menu) lets you configure various Show Buddy Setlist settings.

GENERAL TAB:

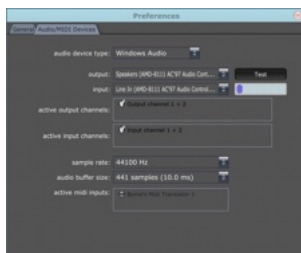

- Lighting controller support – lets you choose whether to use Show Buddy Active or DMXIS as your lighting/video controller.
- Media files location – allows you to customise the location where Show Buddy Setlist keeps your audio files and associated data. This is useful if you prefer to keep large audio files on a separate hard disk.
- Audio behaviour – allows you to choose whether two clicks of the space bar are required to stop audio playback. Also allows you to customise the audio fade in & out time (when starting/stopping playback)
- Colours – allows you to modify the colour of the user interface.

- Font sizes – allows you to customise the various fonts used in Show Buddy Setlist. Larger fonts are obviously helpful if your computer is at a distance on stage.

AUDIO/MIDI DEVICES TAB:

- Allows you to configure the soundcard output device & MIDI input devices. (Note: currently the input device is unused – it can be set to <<none>> if desired).

Note: the MIDI input devices selected here have no effect on any MIDI output messages being transmitted by Show Buddy Setlist.

TRACK MANAGEMENT

IMPORTING TRACKS

There are two ways to import audio tracks into Show Buddy Setlist.

You can select any supported audio file in the standard Windows Explorer or OS X Finder window, and drag it directly into the Show Buddy Setlist main window. Multiple files may be dragged in simultaneously. Those tracks will then immediately appear in the Track Library tree. You can alternatively select the *Tracks > Import Tracks...* menu option.

The track appears in the Track Library tree within a category. This category is the name of the folder that contained the audio file.

Imported audio files are copied to the Show Buddy Setlist media folder. This makes it easier to copy your entire show from one computer to another.

To delete a track, highlight it in the tree, then select *Tracks > Delete selected track*.

You can overwrite tracks already in the library, simply by dragging the revised audio file into Show Buddy Setlist. This is handy if you need to load a revised mix of an existing song. Note: if the timing of the song has changed, you will need to edit your existing lightshows to compensate.

PLAYING BACK TRACKS

First, load the track into Show Buddy Setlist by double-clicking on it in the *Track Library* tree. The waveform of the audio file appears in the timeline.

To play the track, click the space bar, press the Play button.

To stop playback, click the space bar twice. This little safety feature prevents you from accidentally stopping your audio during the show if you bump your keyboard or footswitch. If you prefer, you can disable this behaviour from File>Preferences)

When you stop & start audio in the middle of a track, Show Buddy Setlist gently fades your music in & out, for a more professional sound. (The fade time can be customised from the File>Preferences window.)

Double click on the waveform to move the play-head straight to that point. Or drag the play-head left/right with the mouse.

To zoom in and out on the waveform, hover over a point in the waveform and move the mouse scroll wheel. Alternatively, drag the ends of the box in the overview waveform.

By default, the waveform will scroll during playback to keep the play-head visible. To disable this behaviour, uncheck *View > Follow playback*.

CLICK TRACKS

Show Buddy Setlist can play two audio files simultaneously. For example, you can send the main backing track to your PA, and a click track to your drummer's headphones. For this reason, we refer to the second audio file as the **click track**.

First, you need to select an audio device with at least two stereo outputs in the **Preferences > Audio/MIDI Devices** window. The first stereo output will play your backing tracks, and the second will play any click tracks.

To add a click track, first locate the desired track in your **Track Library** and load it. Then select the "Click track..." button in the main window, and browse to your click track audio file.

Now, when you start playback, both files will play in sync through the selected soundcard outputs.

LIGHTSHOWS

A lightshow is a collection of lighting preset changes (and their fade times), MIDI output data (to control external MIDI devices such as guitar FX units & vocal processors) and memos (to store count-ins, lyrics, chord change or other visual notes). Once a track has a lightshow, you can use that lightshow to build any number of shows.

Each audio track can have one or more lightshows. Why might you need multiple lightshows? You might need to create a new show for a particular gig, or you might have several lighting rigs, a compact rig for pub gigs and a full rig for stage shows.

When you double click a track to load it, the lightshows are shown in the top-right of the main window.

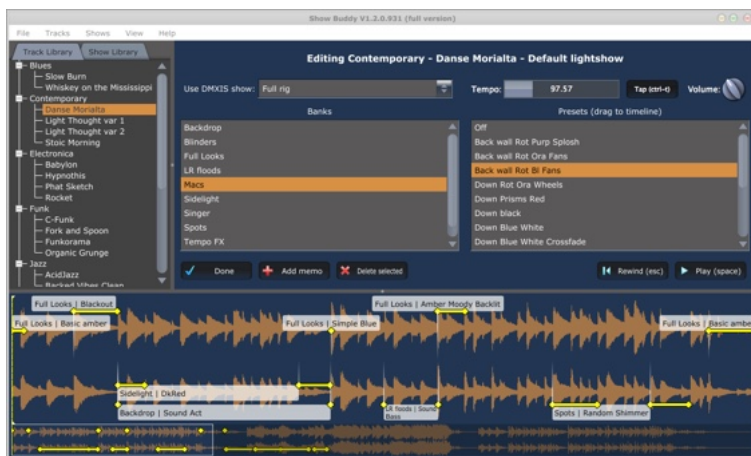

You can edit the lightshow name by double clicking on its name. Each lightshow can also have a custom description – again, double-click on the description to edit it.

You can create a new (empty) lightshow by clicking the *New* button.

You can create a duplicate copy of an existing lightshow using the *Copy* button (useful for backing up lightshows before editing, or quickly creating different lightshow variations)

EDITING LIGHTSHOWS

Arguably, the most important screen in Show Buddy Setlist! First, highlight the required lightshow then click *Edit*. The screen changes to display the available lighting shows, banks & presets...

Choose the lighting show you want to use from the *Use lighting show* menu.

To make the lighting oscillators match the song tempo, adjust the *Tempo* field as necessary – or repeatedly click the *Tap* button or press *Ctrl-T* in time with the song to learn the tempo automatically.

Note: Show Buddy Setlist song tempos override any 'Bank Tempos' defined in the lighting controller.

Adding lighting presets to your track is easy - simply select a bank & preset and drag it onto the waveform. If your presets use masking, you can layer multiple presets, quickly building complex looks. (Please see the Show Buddy Active or DMXIS manual for more information on channel masking).

Once a preset is on the waveform, you can position it by dragging the label or line left/right. For accurate positioning, right-click to auto-zoom the waveform.

To replace a preset with a different one, just drag the new preset over the label of the old one.

To create a copy of one or more presets, first select the presets and press *Ctrl-C* to copy them into the clipboard. Then double click on the waveform to position the play-head, and press *Ctrl-V* to paste the presets in the clipboard at the new position.

Presets in the clipboard can also be pasted into different lightshows or different tracks. To copy & paste the entire lightshow (all cues & memos) to another track, use *Select All (Ctrl-A)* followed by *Copy (Ctrl-C)*. This is easier than manually dragging to select all cues & memos, especially in a busy lightshow.

Alternatively, you can create a copy of some presets by select them and dragging with the mouse while holding down <Ctrl> on your keyboard.

When a lightshow is loaded, Show Buddy Setlist will immediately load any lighting presets at position 0:00. This gives you a “starting look” and lets you design professional looking transitions between songs. To do this, simply drag the label of the preset as far left as possible, and add a fade time by dragging the yellow diamond.

Adjusting audio levels

The Volume knob lets you adjust the audio level for each lightshow. This allows you to compensate for different backing track volumes, and deliver a consistent sounding set.

FADE HANDLES

The yellow diamonds on each preset label are fade handles. Drag these handles left & right to set the fade times. Each preset has its own custom fade time.

Because the fades are displayed directly on the waveform, you can accurately position fades to start & end right on the beat. No more mucking about with fade times in seconds!

Note: the yellow fade handles overrides the Show Buddy Active or DMXIS 'Fade To Next' settings.

NORMAL & LAYERED LIGHTING PRESETS

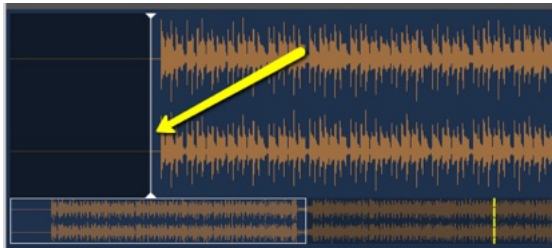

A normal lighting preset will completely replace the current setting of every fixture in your rig. Thus, the easiest way to use Show Buddy Active or DMXIS is to design a bunch of normal presets (each with a full look for your entire rig) and step through them.

This is also the easiest way to design a lightshow in Show Buddy Setlist – just drag a number of normal presets into the timeline, position them and add fade times as necessary.

However, Show Buddy Active and DMXIS also have a feature called “channel masking”. This lets you design presets that only change specific aspects of your rig, while leaving others along (e.g. a preset which changes the colours of your moving heads without changing the pan/tilt positions).

Show Buddy Setlist lets you “stack up” multiple presets at one point in time. So, you can build a full look by dragging several masked presets to the same position.

TRIMMING THE START & END POINTS OF A SONG

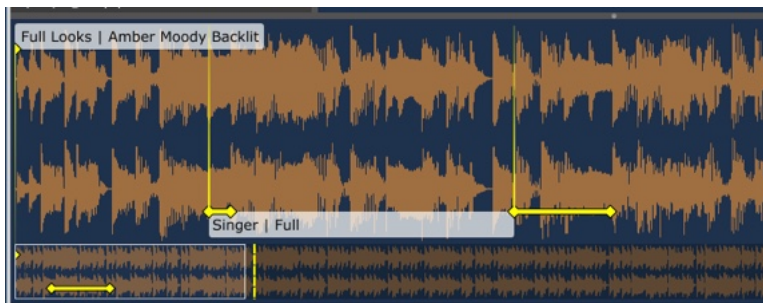

You can drag the white markers at the start & end of each track to adjust the playback start & stop point. This is handy for trimming audio files with long lead-in & out times (as some stock backing tracks tend to have).

This is also handy for making accurate adjustments to the transitions between songs when auto-play is activated, allowing several songs to play as a medley.

'SIMPLE' VS 'MOMENTARY' PRESETS

Say you have a bank of masked presets to control your blinders - “Full ON”, “Strobe” and “Sound Activated”. Remember, these presets ONLY control the blinders, nothing else.

Show Buddy Setlist has a little trick which makes masked presets like this even easier to use. Simply create an extra preset titled “Off”, which (in this case) switches the blinders off. Show Buddy Setlist will now treat this bank as *momentary presets*. When you drag a momentary preset to the timeline, it appears at the bottom of the waveform and has a start AND end position. Your selected preset (e.g. “Full ON”) is loaded at the start, and the “Off” preset is loaded at the end. You can also set separate fade times at the start & end of the preset.

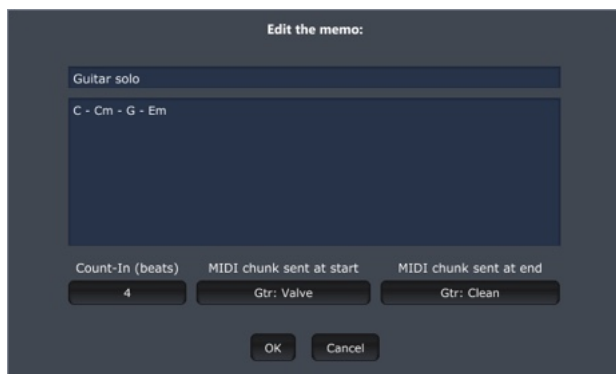

*In this image, a simple preset **Amber Moody Backlit** is loaded into the rig, followed by a **Full** spotlight on the singer. The spotlight quickly fades up from black, holds for a set time, then fades out to black again (all without affecting the amber preset).*

MEMOS

A lightshow can contain a number of memos. Memos are used to display lyrics, chord change reminders, count-ins, or any other text you need to display clearly during the song playback. Memos can also transmit MIDI data to external devices – for example, to automatically switch patches on a guitar FX unit or a vocal processor.

To create a memo, first position the yellow dotted playhead anywhere in the song (by double-clicking on the waveform, or dragging the playhead). Then click the **Add memo** button.

A memo has 5 fields:

- The first field is a **short label**, displayed on the timeline.
- The second larger field is the **memo text** itself. This can consist of multiple lines of text, which will be displayed in a large font during playback.
- The **count-in** field is optional. Normally, memos appear and disappear from the display as defined by their position and size in the waveform. If you define a count-in, the memo

will count-in a set number of beats. This is great if you need to start singing or playing after a long intro with no discernible beat.

- The ***MIDI chunk sent at start & end*** fields are also optional. These allow you to transmit MIDI control data (e.g. patch changes) to external MIDI hardware. This is great for automating your guitar FX patches or vocal harmoniser settings. We'll go into this feature in more detail in the next section.

You can select, move, resize and copy/paste memos exactly as for presets.

LYRICS QUICK IMPORT

It would be tedious to create lyrics manually using the standard memo feature. The lyrics quick import function offers a much quicker & easier way to add lyrics to your Show Buddy Setlist tracks.

First, load up your lightshow in edit mode.

Then, select **Lyrics quick import...** in the **Tracks** menu.

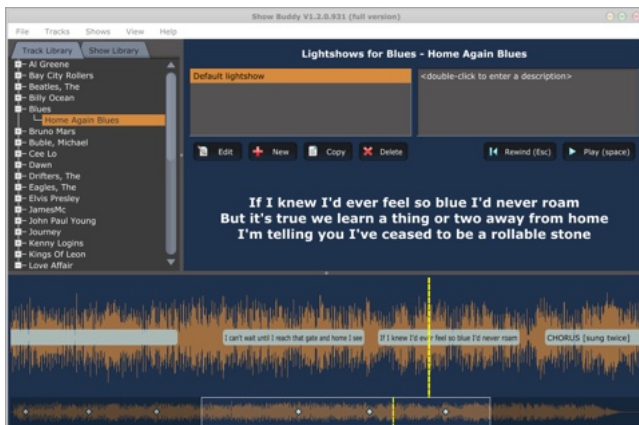

The quick import window appears. Simply paste your lyrics for the entire song into the window. Make sure you have a blank line between each verse, chorus etc.

Press OK when you're done.

This immediately creates a number of new memos, one for each section of the lyrics. Simply resize & position these memos as required to match the song.

And you're done!

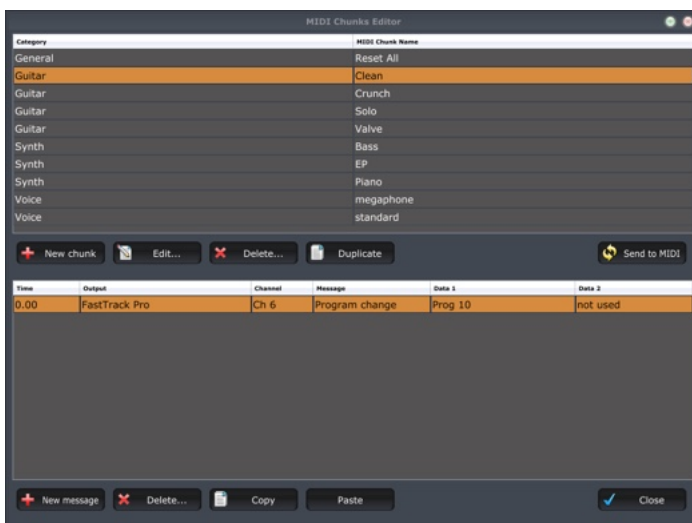

TRANSMITTING MIDI CONTROL DATA TO EXTERNAL HARDWARE

As well as playing your audio and controlling your lighting rig, Show Buddy Setlist can also control your external MIDI devices. If you use devices such as guitar fx pedals, vocal harmoniser or hardware/software synths, Show Buddy Setlist can automatically switch banks, adjust volumes or send any other control data.

To do this, you first need to define some **MIDI chunks**. A MIDI chunk is a series of MIDI messages to control one or more devices. A simple chunk might send a single patch change message to a guitar pedal. A complex chunk might initialise the patch, pan & volume levels of multiple devices.

Creating MIDI Chunks

To define your MIDI chunks, open the **MIDI Chunk Editor** from the View menu (or press Ctrl-m)

To create a new chunk, click **New Chunk** and enter a category (e.g. “Guitar”) and name (e.g. “Distortion Patch”).

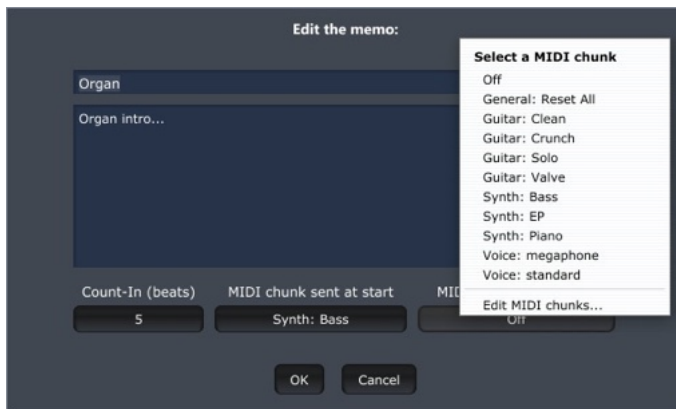

Each chunk can have one or more MIDI messages, shown in the lower table. To add a message to a chunk, click **New Message** and then click on each cell to define the target MIDI interface, channel, message type and associated data. (For example, the above screen-shot shows a single program change (value 10) being sent to MIDI channel 6 on the 'FastTrack Pro' MIDI interface).

If the “Send to MIDI” button is on, the MIDI chunk will be transmitted whenever it is selected in the upper table, or its message content is changed in the lower table. This allows you to easily test that the chunk contains the correct data.

Other options in this window allow you to quickly make copies of existing chunks & messages.

Adding MIDI chunks to a lightshow

Once you have defined some MIDI chunks, you can add them to your lightshows via the memo editor window:

Simply click on the two MIDI chunk buttons, and select which chunk should be transmitted at the start & end of that memo.

For example, you could create a memo for a guitar solo in a track, which gives you a 4 beat count-in, loads the “Guitar:Solo” patch at the start, and loads the “Guitar:Clean” patch at the end.

BUSKING A SHOW FROM THE TRACK LIBRARY

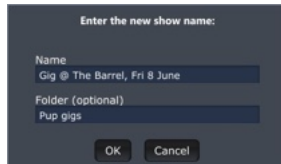

Once you have created your lightshows, it is perfectly possible to run your full live show using only Track Library. Simply double-click on the songs as you need them, then press space-bar to perform that song.

However, Show Buddy Setlist lets you go a step further and organise your songs beforehand into ordered shows. More in the next chapter...

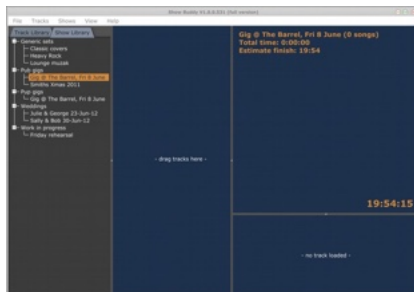

SHOWS AND THE SHOW LIBRARY

A show consists, quite simply, of a list of lightshows in order. A show is a simple mechanism that lets you prepare in advance for a gig by selecting your songs and lightshows in advance, and organising them into a running order.

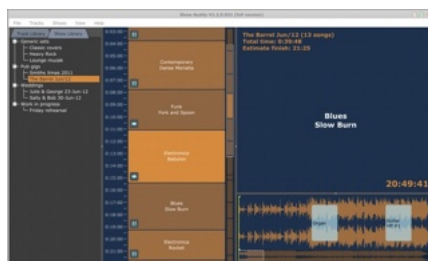

To create a new show, go to the **Show Library** tab, and select **Shows > New show** in the menu.

Enter the gig name and an optional category, then press OK. You see the new show appear in the tree. Highlight it to load the show (which at the moment is an empty timeline).

Now, switch to the Track Library and drag some songs into the timeline to build up your show.

As you build up your show, the total number of songs and run time is updated in the main panel.

For example, in the above show

To change the order of a song in a show, highlight it then drag it up & down.

To remove a song from the show, highlight it and press the Delete key.

The show timeline can be zoomed and panned in the same way as the song waveform (using the scroll wheel etc.)

PLAYING A SHOW

Load a show by clicking it in the Show Library tree. The first song will be automatically loaded, and the initial lighting presets (at 0:00 position) are automatically loaded. You're ready to play the first song.

*Note that the **Estimate finish** field shows you a rough estimate of when the gig will finish. This field will update dynamically as you play your gig, even if you change the contents of the show by adding, moving or deleting songs as you go.*

Press the space bar to start playing the first song. Show Buddy Setlist will play the song (and lightshow), updating the two timelines in real time and displaying any memos and count-ins.

At the end of the song, Show Buddy Setlist will automatically load the next song in the show, load the initial lighting presets at 0:00 and wait. Press the space bar to play the next song.

You can play a show in random order if you wish. To load a different song, just double-click it in the show timeline, or use the **up/down** arrow keys to highlight the next song, followed by **Enter** to load it.

Note: you can use a MIDI controller to select songs in the show timeline, and start/stop playback. See page 11 for more information.

You can also add or delete songs from your show as the gig progresses, perhaps in response to audience requests.

AUTO-PLAY

By default (as described in the previous section) when a song finishes playing, Show Buddy Setlist will cue up the next song, load any lighting preset at time 0:00, and then wait.

If you want the next song to play automatically (e.g. to play a number of tracks as a medley) simply double-click on the 'pause' symbol in the song. It will change to a right arrow, indicating that the next song will begin playing automatically.

For example, this show will pause at the end of *Danse Moriaita*, then *Fork and Spoon*, *Babylon* and *Slow Burn* will play as a medley.

If you activate auto-play for the every song in a show, then the show will loop indefinitely.

LOOPING

Double-click on the loop icon in any song to make it play in a loop indefinitely. Pressing the spacebar or transmitting a MIDI 'Play' command cancels the looping. This simple looping feature opens up a number of creative possibilities, for example:

- you may want to interact with your audience for a while in the middle of a song, without stopping playback.
- there may be a guitar solo in the middle of a song, whose duration could change every time you play.
- you may want to build the tension at the start of a song by looping an 8 bar intro.

You can either load separate audio files for each loop, or create your loops in Show Buddy Setlist by creating multiple lightshows for one audio track, setting the loop start/end points on each lightshow as required.

EXPORTING A LIGHTSHOW FOR USE WITHIN A DAW

Under the **File** menu, you'll find the **Export lightshow to MIDI file** option. This will create a MIDI file containing MIDI Note messages (on MIDI channels 15 & 16) to replicate that lightshow within a VST/AU host such as Ableton Live, Logic or Cubase.

Thus, you can use Show Buddy Setlist to create complex light shows which would be difficult if not impossible to edit in a typical MIDI editor page within a sequencer.

You should ensure the lightshow tempo and ppqn resolution of the exported MIDI file matches that in your host.

Exported MIDI files are encoded with the tempo defined in the Show Buddy Setlist lightshow editor page (default 120bpm). Exported MIDI file resolution (default 960ppqn) can be specified in the Preferences window.

Both simple and momentary presets changes will be exported to the MIDI file.

Limitations of the export feature

- If your lightshow has multiple presets at the same point in time, the exported MIDI file will stagger these presets a few milliseconds apart. This is to get round the limitation whereby the Show Buddy Active & DMXIS plug-ins cannot process multiple bank/preset changes simultaneously.
- Fade-in & fade-out times defined in your lightshow (via the yellow diamonds) will not be exported to the MIDI file. The plug-in will use the standard **Fade To Next** settings defined in the Preset Manager page for each preset.
- MIDI chunks (transmitted via notes) are not included in the MIDI file.

REVISION HISTORY

RELEASE 1.8

- Rebranded – **Show Buddy** is now **Show Buddy Setlist**
- New demo mode (fully functional apart from intermittent noise bursts)
- Added **View > Remote control** window. Allows playback (start/stop, next/previous, rewind) to be controlled via keyboard or MIDI.
- Colour scheme can now be modified from **Preferences** window.
- Add transport controls to set player (for touchscreen control of show).
- Added click tracks – a second independent stereo output.
- Added fixed spacing (left-aligned) memos, for lyrics.
- The live audio input can now be used to drive sound-activated lighting effects.
- Fixed looping bug (would sometimes exit loop unexpectedly).
- Fixed drag & drop of audio files onto library panel.
- Fixed import of m4a files on macOS 10.14
- Fixed intermittent glitch at start of track, when autoplays songs in a setlist.
- Bugfix when Show Library contains only one show - clicking on the show name will always force the show panel to be become visible.
- Fixed SQLITE_ERROR message when repositioning presets containing an apostrophe.
- Bugfix - can now create memos (and perform quick lyric import) with extended special characters (e.g. Swedish å ä ö)
- Bugfix – exported MIDI files now specify the correct tempo.
- The resolution of exported MIDI files (in ppqn) can now be changed in Preferences.

RELEASE 1.6

- Added support for Show Buddy Active.
- 'L' keystroke shows/hides the library panel.
- Slowed down refresh rate of waveform window, to greatly reduce CPU load with complex songs.
- Bugfix : fix DMXIS plugin sizing problems on high resolution Windows devices (e.g. Microsoft Surface tablets)
- Bugfix : remember state of Auto Zoom. Auto Zoom also defaults to OFF.
- Bugfix : improved error checking of "New lightshow" button.

RELEASE 1.5

- Feature: looping. Any track in a set can be set to loop until footswitch/spacebar is pressed (or a MIDI Play command). Allows more flexibility in a performance (e.g. looping a section of music while interacting with the crowd). Small audio buffers are recommended for good looping quality.
- Feature: added 'loop' toggle button to song editor. Useful for accurately setting start/stop trim points.
- Added 'S' and 'E' keyboard command to quickly set audio trim points.
- Feature: Add new popup submenus to MIDI device selection (in the MIDI Chunk Editor) to allow global changes to output devices. This is very useful if you switch MIDI cards for any reason.
- Feature: Added copy/paste of lighting cues & memos. Allows more controlled, accurate placement of copied cues/memos than the existing method. Also allows copy/paste of cues & memos between songs and lightshows.
- Feature: Added 'Select All' option to Edit menu. Facilitates quick copy/paste of the entire light show (all cues & memos) between different tracks.
- Feature: added search box to Track Library & Set Library.
- Feature: Added auto-zoom (activated via 'Z' key & menu) to set timeline. Keeps current song visible at a sensible zoom level (whether playing or browsing). Very useful for sets with a mix of long & short songs.
- Feature: (new preferences option) play track immediately upon receiving MIDI Next/Prev commands.
- Enhancement: Now uses native window title bars. Allows full-screen operation on OS X.
- Enhancement: Added lightshow names to set list.
- Enhancement: Set list now displays correct song length when start/end points have been trimmed. Particularly helpful if you are using trim points to loop a song section. The set finish time is also more accurate.
- Enhancement: Improved efficiency of audio playback (songs now preload quicker).
- Bugfix: now detects DMXIS hardware reliably on startup.
- Bugfix: improved operation of show screen. (Previous version could become inoperable if only a single show was defined in the library)
- Bugfix: fixed intermittent crash when loading DMXIS shows.
- Bugfix: sometimes playback would immediately fade out when starting a song.
- Bugfix: restored OS X 32-bit Intel compatibility.
- Bugfix: set timeline redraws correctly when reordering songs whilst playing.
- Bugfix: fixed random crashes in MIDI Chunk Editor
- Bugfix: Fixed intermittent MIDI connection failures on OS X.

RELEASE 1.4.2

- Bug fix: DMXIS cues were intermittently playing late, especially on busy songs with many tightly spaced cues.
- Bug fix: Opening & closing the Preferences window would break the Track Library contents.

RELEASE 1.4.1

- Feature: added audio volume control to editor screen. Track playback volume can now be customised for each lightshow.
- Feature: location of the Show Buddy Setlist media library can now be customised in Preferences.
- Feature: upgraded Show Buddy Setlist to work with the latest DMXIS 1.4 release. This also supports operation in OS X 10.9 Mavericks. (DMXIS 1.4.3 or better required)
- Feature: Show Buddy Setlist can now run without DMXIS hardware. The DMXIS hardware can be hot-swapped during a show, and connecting a different DMXIS box does not require re-authorisation of the Show Buddy Setlist license.
- Bug fix: the DMX output signal does not randomly fluctuate when manually moving the play position around a track.

RELEASE 1.3.0

- Feature: added full undo/redo.
- Feature: set order can be changed using Ctrl-Up/Down keystrokes.
- Feature: improved visualisation of set re-ordering.
- Feature: added menu option to delete song from set.
- Feature: copy/paste of memos (via <ctrl-drag> mechanism as for copying cues)
- Bug fix: dialog boxes now display properly in Windows 8
- Bug fix: set order is reliably maintained when reordering or adding new songs.
- Bug fix: fixed crash when copying a lightshow containing memos.

RELEASE 1.2.0

- Fixed intermittent crashes on OS X.
- Added **auto-play** option, allowing consecutive songs in a show to play as a medley. Also allows looped playback of shows (for example, to automatically run music & lighting pre-show, or during an interval)
- The **start & end play point** can now be adjusted for each audio track. Allows slick transitions between songs - especially useful with the new auto-play feature, or when using stock audio files with long lead-in/lead-out times. (Can also be used to quickly set play start & stop markers while editing a lightshow)

- **Fast lyrics import** feature. Previously, importing lyrics by manually creating multiple memos was a tedious task. Fast import lets you import all the lyrics for a song in one go. Simply paste in the lyrics (with blank lines separating each verse/chorus etc. Fast import will automatically split the lyrics into multiple memos, which can then be quickly resized & positioned.

RELEASE 1.1.0

- Bug fix: audio files containing apostrophes or extended characters can now be imported correctly.
- Bug fix: audio files with no parent folder (i.e. files at the root folder of a disk) can now be imported correctly.
- Added **MIDI output** feature (Show Buddy Setlist can now send patch changes and other control messages to external hardware devices and MIDI programs).
- Added **MIDI Chunk Editor** (for creating reusable MIDI messages, see previous).
- Added **Export to MIDI file** (under File menu). Allows lightshows to be exported for use with the DMXIS plug-in in an alternative VST/AU host (such as Ableton Live or Logic)
- You can now easily replace audio files already in the track library by drag & drop (for example, if you need to import a modified mix of a song).
- Simplified installation process for Windows users. (It is no longer necessary to manually locate the DMXIS VST plug-in)
- The *Click twice to stop playback* (from space bar or footswitch) feature can now be disabled in Preferences.
- Audio fade time (when stopping & starting playback) can now be customised in Preferences.

RELEASE 1.0.1

- Bug fix: presets selected directly in the DMXIS window were not loading correctly.
- Fixed crash when no audio output is enabled. Now prompts you to select an output in the Preferences window.

RELEASE 1.0.0

- Initial public release

- end of document -
